

## CENTER AIRFIELD TAXIWAY CONNECTOR

HARTSFIELD-JACKSON ATLANTA  
INTERNATIONAL AIRPORT

Prime Engineering was selected by the Hartsfield-Jackson Development Program to support the extensions of Taxiways SC and SJ. The project provides direct, dual parallel taxiway connections between the Central Passenger Terminal Complex and the South Airfield Complex, including Runway 10/28 and its associated taxiways.

Prime developed bid documents for more than 530,000 square feet of concrete pavement averaging 22 inches in thickness. Prime developed three alternative phasing/staging/safety plans, all of which had to be coordinated with the airport, airlines, and other stakeholders in order to determine the most efficient construction schedule in shutting down two of the five runways at the world's busiest airport.

The project was successfully bid under Prime's construction estimate.
